

Spirax EasiHeat™ HTG Heating System Compact Heat Transfer Solution

Installation and Maintenance Instructions

IM-P481-03-US

September 2017

1. Safety information
2. General product information
3. Installation
4. Commissioning
5. Operation
6. Maintenance

All rights reserved

Spirax-Sarco Limited grants the legal user of this product (or device) the right to use the Work(s) solely within the scope of the legitimate operation of the product (or device). No other right is granted under this licence. In particular and without prejudice to the generality of the foregoing, the Work(s) may not be used, sold, licensed, transferred, copied or reproduced in whole or in part or in any manner or form other than as expressly granted here without the prior written consent of Spirax-Sarco Limited.

1. Safety information

In addition to putting your personnel at risk of death or serious harm, failure to comply with the instructions, recommendations and guidance set out in this document may jeopardize your warranty rights. Further, use of the product(s) otherwise than in accordance with this document will be undertaken entirely at your own risk. To the fullest extent legally permitted, Spirax Sarco excludes all responsibility and liability for any and all loss or damage caused in the event that the practices and procedures detailed in this document have not been followed.

Safe operation of this product can only be guaranteed if it is properly installed, commissioned, used and maintained by qualified personnel (see Section 1.11) in compliance with the operating instructions. General installation and safety instructions for pipeline and plant construction, as well as the proper use of tools and safety equipment must also be complied with.

Note: This document refers only to the mechanical installation and commissioning of the Spirax EasiHeat™ HTG packaged heat exchange system unit and should be used in conjunction with the relevant IMIs for the other system components and supplementary safety information for all the system components.

Warning

This product is designed and constructed to withstand the forces encountered during normal use.

Use of the product for any purpose other than its intended use could cause damage to the product and may cause injury or fatality to personnel.

Before any installation or maintenance procedure, always ensure that all primary steam and condensate return lines and secondary water lines are isolated.

Ensure any residual internal pressure in the system or connecting pipework is carefully relieved.

Allow hot parts to cool before commencing work, to avoid the risk of burns.

Always wear appropriate safety clothing before carrying out any installation or maintenance work.

Lifting

The Spirax EasiHeat™ unit should be lifted by a suitable forklift truck, from the base, placed in position and securely bolted to the floor.

Warning:

On no account is the Spirax EasiHeat™ unit to be lifted by any other part, other than the base.

Note: Sufficient space should be provided around the systems location to allow access for maintenance.

Safe operation of these products can only be guaranteed if they are properly installed, commissioned, used and maintained by qualified personnel (see Section 1.11) in compliance with the operating instructions. General installation and safety instructions for pipeline and plant construction, as well as the proper use of tools and safety equipment must also be complied with.

1.1 Intended use

Referring to the Installation and Maintenance Instructions, name-plate and Technical Information Sheet, check that the product is suitable for the intended use/application.

- i) The product has been specifically designed for use on steam, air or water/condensate. The products' use on other fluids may be possible but, if this is contemplated, Spirax Sarco should be contacted to confirm the suitability of the product for the application being considered.
- ii) Check material suitability, pressure and temperature and their maximum and minimum values. If the maximum operating limits of the product are lower than those of the system in which it is being fitted, or if malfunction of the product could result in a dangerous overpressure or overtemperature occurrence, ensure a safety device is included in the system to prevent such over-limit situations.
- iii) Determine the correct installation situation and direction of fluid flow.
- iv) Spirax Sarco products are not intended to withstand external stresses that may be induced by any system to which they are fitted. It is the responsibility of the installer to consider these stresses and take adequate precautions to minimize them.
- v) Remove protection covers from all connections and protective film from all name-plates, where appropriate, before installation on steam or other high temperature applications.

1.2 Access

Ensure safe access and if necessary a safe working platform (suitably guarded) before attempting to work on the product. Arrange suitable lifting gear if required.

1.3 Lighting

Ensure adequate lighting, particularly where detailed or intricate work is required.

1.4 Hazardous liquids or gases in the pipeline

Consider what is in the pipeline or what may have been in the pipeline at some previous time. Consider: flammable materials, substances hazardous to health, extremes of temperature.

1.5 Hazardous environment around the product

Consider: explosion risk areas, lack of oxygen (e.g. tanks, pits), dangerous gases, extremes of temperature, hot surfaces, fire hazard (e.g. during welding), excessive noise, moving machinery.

1.6 The system

Consider the effect on the complete system of the work proposed. Will any proposed action (e.g. closing isolation valves, electrical isolation) put any other part of the system or any personnel at risk?

Dangers might include isolation of vents or protective devices or the rendering ineffective of controls or alarms. Ensure isolation valves are turned on and off in a gradual way to avoid system shocks.

1.7 Pressure systems

Ensure that any pressure is isolated and safely vented to atmospheric pressure. Consider double isolation (double block and bleed) and the locking or labeling of closed valves. Do not assume that the system has depressurized even when the pressure gauge indicates zero.

1.8 Temperature

Allow time for temperature to normalize after isolation to avoid the danger of burns.

1.9 Tools and consumables

Before starting work ensure that you have suitable tools and/or consumables available. Use only genuine Spirax Sarco replacement parts.

1.10 Protective clothing

Consider whether you and/or others in the vicinity require any protective clothing to protect against the hazards of, for example, chemicals, high/low temperature, radiation, noise, falling objects, and dangers to eyes and face.

1.11 Permits to work

All work must be carried out or be supervised by a suitably competent person. Installation and operating personnel should be trained in the correct use of the product according to the Installation and Maintenance Instructions. Where a formal 'permit to work' system is in force it must be complied with. Where there is no such system, it is recommended that a responsible person should know what work is going on and, where necessary, arrange to have an assistant whose primary responsibility is safety.

Post 'warning notices' if necessary.

1.12 Handling

Manual handling of large and/or heavy products may present a risk of injury. Lifting, pushing, pulling, carrying or supporting a load by bodily force can cause injury particularly to the back. You are advised to assess the risks taking into account the task, the individual, the load and the working environment and use the appropriate handling method depending on the circumstances of the work being done.

Please note that if lifting straps are required we would recommend that they be fitted around the baffle plate legs to prevent damage to the unit.

2. General product information

2.1 General information

The Spirax EasiHeat™ HTG (Heating) incorporating S.I.M.S technology is a complete, compact and ready-to-use steam to water heat transfer solution that delivers superior energy efficient performance. It has been designed for applications with stable load conditions such as closed circuit heating applications. The Spirax EasiHeat™ HTG can help you lower costs, tackle waste and mitigate your environmental impact by reducing your CO₂ emissions and carbon footprint, making a positive change towards a more sustainable future.

The base unit of the Spirax EasiHeat™ provides the core of the system, while options (see Sections 2.2) provide additional features such as: high limit package, stop valve package and energy monitoring.

The Spirax EasiHeat™ HTG unit consists of the following core items (refer to Figure 1):

- A** Plate heat exchanger.
- B** Pneumatic or electrically actuated control valve and positioner.
- C** PLC controller.
- D** Pipeline ancillaries.

Fig. 1 Spirax EasiHeat™ HTG compact heat transfer solution

Notes:

1. For additional information about any particular product used in the construction of this unit see the relevant product specific Technical Information (TI) sheet.
2. For further technical information regarding the Spirax EasiHeat™ HTG see the Technical Information sheet TI-P481-01-US.

2.2 Spirax EasiHeat™ HTG nomenclature

The product nomenclature is a reflection of the core items and unit options that have been ordered and supplied – See the table below:

Spirax EasiHeat™ HTG nomenclature example:

EHHCC	2	L	A	EL4	-	HL	B	V1	G1	W	-	T6	E	R2	C1	O1
-------	---	---	---	-----	---	----	---	----	----	---	---	----	---	----	----	----

Spirax EasiHeat™ Heating Condensate Control nomenclature

Compulsory Selection	Building Heating Unit	EHHCC	=	Spirax EasiHeat™ Heating Condensate Control	EHHCC	
	Control valve size	1	=	½"	2	
		2	=	¾"		
		3	=	1"		
	Pressure vessel code	A	=	ASME	A	
	Actuation	EL4	=	Electric (SIMS)	EL4	
	PN	=	Pneumatic			
Mechanical Options	High limit	HL	=	High limit (SIMS)	HL	
		IHL	=	High limit (SX90)		
	High limit actuation EL only	B	=	Battery back-up	B	
	Manual isolation valve	V1	=	Ball valve	V1	
		V2	=	Gate valve		
	Gasket material	G1	=	EPDM	G1	
	Extras	W	=	Wheels	W	
	Panel Options	Panel type	T6	=	110V UL SIMS touch screen	T6
			P2	=	110V UL process controller	
		Energy monitoring	E	=	With energy monitoring	E
Remote access		R1	=	Level 1 - SMS text and e-mail	R2	
		R2	=	Level 2 - 3G web access		
		R3	=	Level 3 - both of the above (R1+R2)		
Communication Options	C1	=	Modbus RTU	C2		
	C2	=	BACnet MS/TP (RS485)			
	*C3	=	Modbus TCP/IP (Client)			
	C4	=	Profinet			
	C5	=	CanOPEN			
	*C6	=	BACnet TCP/IP (Client)			
	C7	=	Profibus RS485			
Options	O1	=	Selected option 1	O1		
	O2	=	Selected option 2			
	O3	=	Selected option 3			

* Note: not available when panel options R2 or R3 selected

3. Installation

3.1 Steam and condensate connections

It is important that the steam supply (and compressed air if pneumatic actuation is selected) to the Spirax EasiHeat™ HTG unit is supplied as dry and as clean as possible, in accordance with good steam engineering practice.

It should also be ensured that all connecting pipework is stress free and adequately supported.

The steam supply should always be maintained at the specified design pressure and temperature for the unit. The Spirax EasiHeat™ HTG must not operate above the maximum steam pressure and temperature indicated on the name-plate attached to the plate heat exchanger.

The installation of an appropriately sized safety valve, to protect any lower pressured equipment on either the hot or cold side of the plate heat exchanger, is strongly recommended.

Spirax Sarco supplies a range of traps, strainers, separators, safety valves and pressure reducing equipment.

3.2 Air supply

If a pneumatic control system is installed, connect a compressed air supply (4.5 to 8 bar g (65 to 116 psi g)) to the pressure regulator mounted on the control valve.

3.3 Electrical supply

All electrical wiring and connections should be carried out in accordance with National Regulations.

A lockable isolator / switch disconnect should be fitted adjacent to the unit.

Mains supply is directly connected to the primary side of the incoming control panel isolator (shown with the IP2X cover removed) and main ground terminal as shown in Figure 2.

Fig. 2

3.4 Electrical specifications

Electrical supply: Refer to the name-plate on the unit

Control panel supply voltage	110 Vac/60 Hz
	240 Vac/50 Hz
Control panel load requirements	Internally fused at 5 amps
Electrical control actuator	24 Vac
	4 - 20 mA control
Pneumatic control actuator	-
	4 - 20 mA control
High Limit isolation valve (optional)	24 Vac
Steam flowmeter TVA (optional)	4 - 20 mA control
PT100 temperature sensors	3 wire

Note: Power supply 10 - 16 A

3.5 Electrical connections

The following are available for customer connection to the Spirax EasiHeat™ system if required:

Volt free contacts

Terminal designation	Description	Type
X14	Enabled/running signal	1 x N/O contact
		1 x N/C contact
X15	High Limit alarm	1 x N/O contact
		1 x N/C contact
X16	Band Alarm	1 x N/O contact
		1 x N/C contact

Fig. 3

Remote operation and retransmission connections

Terminal designation	Description	Type
X7	Remote set point	4-20 mA input
X17	Remote enable	24 Vdc signal
X9	Retransmission value	4-20 mA output

Fig. 4

Terminal layout overview

Fig. 5

Terminal layout detailed

Note: for detailed wiring schematic options please refer to the 'Operations manual'.

- | | |
|---|--|
| 1. Basic | Group X10B to X13C |
| 2. Independent high limit | X10B - Linear actuator closed signal |
| 3. Independent high limit with safety | X10C - Linear actuator supply voltage (Linear actuator A - Electric actuator only) |
| 4. American standard | |
| X1 - Water temperature IN | X10D - Linear actuator B supply |
| X2 - Water temperature OUT | X10F - Positioner A DC supply |
| X3 - Make up water | X10G - Positioner B DC supply |
| X4 - Return water | X11 - Bypass pump |
| X5 - High limit temperature | X12 - Bypass valve |
| | X13 - High limit valve |
| Group X6 to X10A | X13A - High limit valve control output signal |
| X6 - Linear actuator feedback | X13B - High limit valve supply voltage (electric actuator only) |
| X7 - Remote PID loop set point | X13C - High limit valve battery signal |
| X8 - Steam meter | |
| X9 - Retransmission value | Group X14 to X17 |
| X10A - Linear actuator control position | X14 - Volt free signal for enabled |
| | X15 - Volt free high limit |
| | X16 - Volt free band alarm |
| | X17 - Remote enable signal |

4. Commissioning

We recommend that you use the service and support of a Spirax Sarco commissioning engineer. Details of this service can be found by contacting Spirax Sarco.

Note: Pre commissioning requirements:

- In most new installations, dirt collects in the steam pipeline during construction of the system. It is essential to flush this out prior to commissioning.
- Ensure the secondary (cold side) of the system is charged and all air is bled from the system.
- Ensure that all main isolation valves for both steam and water are isolated.
- Ensure that the electrical supply to the Spirax EasiHeat™ is isolated.
- Double check that all steam, condensate and water connections are correctly connected to the Spirax EasiHeat™.
- Check all flange bolts are tight.

4.1 Mechanical commissioning procedure:

- Check that all the electrical connections are secure and as per the wiring diagram (Section 3.3, Figure 2).
- Dry commissioning valve stroke check - An initial valve stroke check should be carried out to ensure free movement of the valve stem.

1. For the electric actuated control valve, use the manual override on top of the actuator to raise and lower the actuator spindle between the two travel indicators located on the side of the pillar (Figure 6).

2. For the pneumatic actuated control valve, remove the existing air supply and connect an independent air supply to the actuator (pressure not to exceed 6 bar g (87 psi g)), allow the valve to fully open, remove the air supply from the actuator allowing the valve to close. Reconnect the original pipework (Figure 7).

- Open the secondary (cold side) isolating valves downstream of the Spirax EasiHeat™.
- Start the main secondary water circulating pump(s) if fitted.
- Check and confirm there is secondary water circulation through the Spirax EasiHeat™.
- If the circulation is okay, switch on the main power to the control panel (local isolator).
- Turn the control panel isolation switch to 'ON'.
- Follow the quick start-up guide (WHERE) before opening the steam isolations valves.

4.2 TVA quick commissioning:

The TVA flowmeter is factory set to display data in metric units (changeable to imperial if required by following the flow chart, Figure 10, or the individual product Installation and Maintenance Instructions (IMI)).

All commissioning of the TVA is through the arrow buttons located on the front display see Figure 8.

Fig. 8

Press and hold down the 'OK' button and hold for 3 seconds, then enter the default pass code.

Use the up and down arrows to set the number then press OK to confirm your selection, repeat until all numbers are entered.

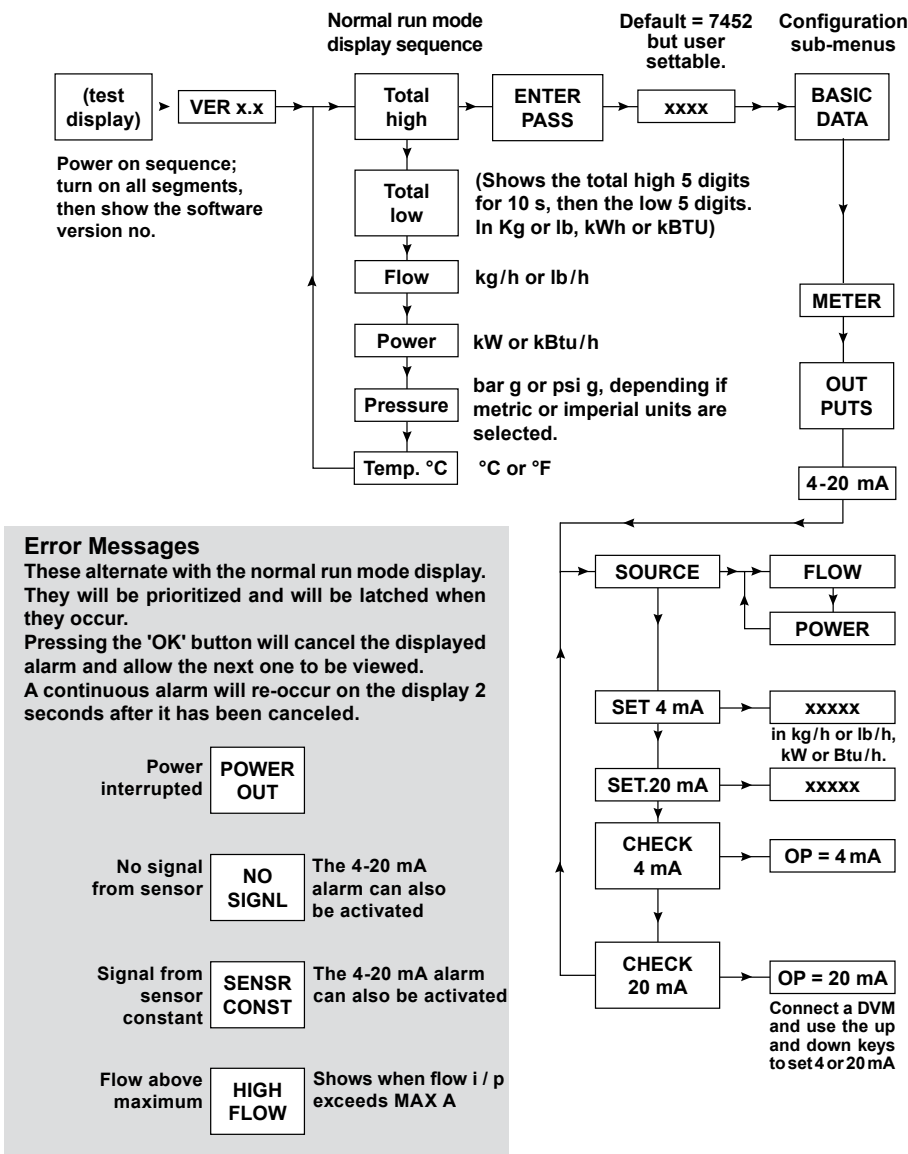

Fig. 9

4.2.1 TVA flowmeter commissioning chart

To navigate around the first level menu use the up and down arrows, to enter any sub menu use the right arrow.

Fig. 10 TVA configuration displays

From the Basic DATA menu navigate to OUTPUTS and press the right arrow to enter the sub menu of 4 - 20 mA.

Fig. 11

The next menu Sorce will need FLOW to be selected.

Obtain the correct flow data from the Spirax EasiHeat™ specification sheet supplied for accuracy, thereafter navigate down the menu and input: -

Minimum flow = 4 mA
Maximum flow = 20 mA

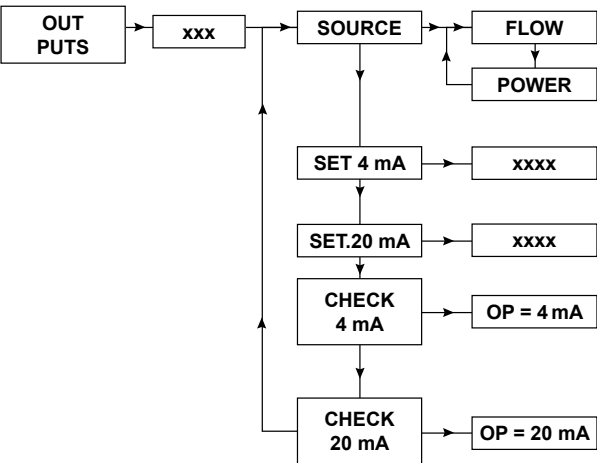

Fig. 12

After this data has been input, continually press the left arrow button to take you back to the run mode.

This completes the basic requirement for scaling of the TVA flowmeter suitable for integration with the HMI.

4.3 HMI quick start commissioning procedure:

The HMI display is a 7" touch screen, and the following procedures detail a basic set-up of the control system from initial power up. A more detailed description of each individual feature can be found in the full operation and maintenance manual.

Fig. 13

When ready the above screen will appear - touch the screen. If the unit has not already been configured the following page will appear:

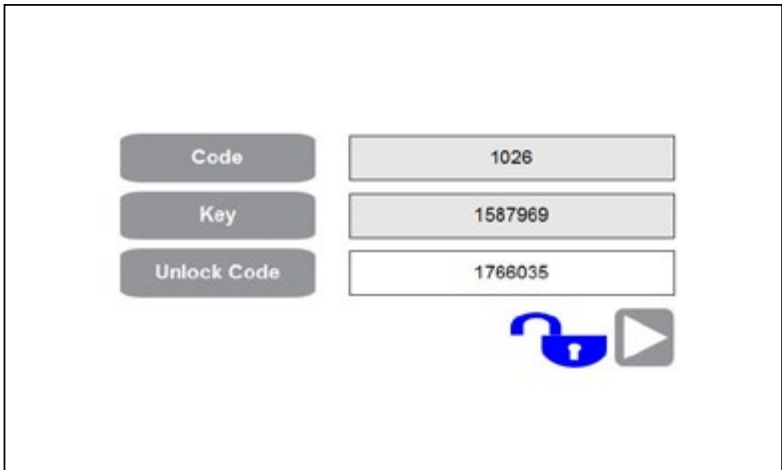

Fig. 14

To be able to move to next page the unlock code is essential, after entering the correct unlock code, the lock icon and the continue button will appear which will transfer you to the time/date setting page - See Figure 15.

11:57:35
06/10/2016

	UPDATE	PLC	HMI
YYYY	2016	2016	2016
MM	10	10	10
DD	06	6	6
HH	10	10	10
MM	56	56	56
SS	02	3	2

▶

Fig. 15

After unlocking the system (by using the unlock code) and setting the time and date or if the unit has been returned to factory default one of the following four pages will appear (pre-configured for designated region):

Fig. 16

Fig. 17

Fig. 18

Fig. 19

By choosing the relevant flag for your Country the common default engineering units and language will automatically be selected for that region. These values can be changed after the initial commissioning set-up procedure has been completed (see page 33).

The system will advance automatically to allow the selection of the relevant Spirax EasiHeat™ unit - The type of Spirax EasiHeat™ unit that is available is dependent on the flag selection.

The next screen (Figure 20) requires confirmation of the system to be configured:

Fig. 20

Based on the selection of a HTG system the selection will be confirmed by the icon becoming highlighted with a blue surround and a continue button will appear.

Press the continue button to advance to the system configuration menu.

The system configuration is now required to be entered on this page; again a selection is highlighted by a blue surround around the icon.

Fig. 21

The system configuration should match the mechanical configuration of the Spirax EasiHeat™ and control system of the plant, correct configuration will show or hide options that are available after configuration. Some of the screens may contain additional options which with specified configuration may be hidden; all the options are described in this document.

Spirax EasiHeat™ mechanical and control system configuration options are detailed below and page 20:

Fig. 22 High-limit selection

TVA not installed and no outside weather compensation selected

If the Spirax EasiHeat™ unit is not fitted with a TVA flowmeter then the system configurations are now complete and the continue navigation button at the bottom right of the screen can be used to navigate to the next page which is the Start Page (with the blue hand).

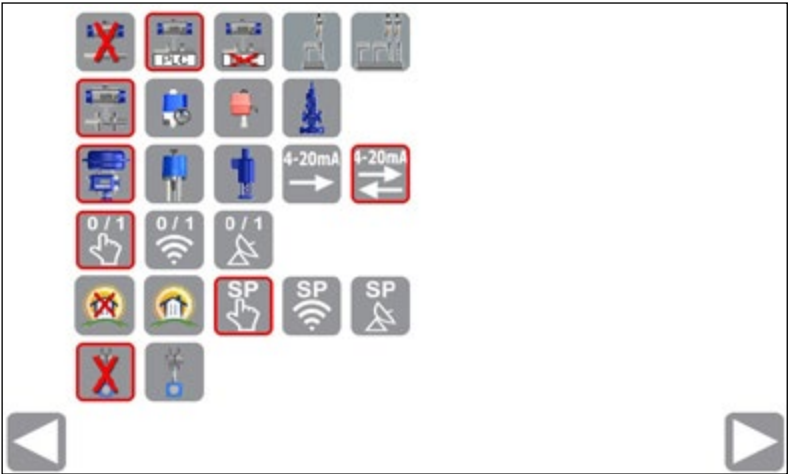

Fig. 30

TVA installed and outside weather compensation selected

On TVA flowmeter selection a data entry point shall be displayed in order for effective scaling of the flowmeter (full engineering range for the 4-20 mA signal input to the Spirax EasiHeat™ system). The full range values entered at this point should match exactly those that are programmed in the TVA flowmeter parameters (Refer to Sections 4.2 and 4.2.1 for TVA commissioning data) as well as outside weather compensation set point.

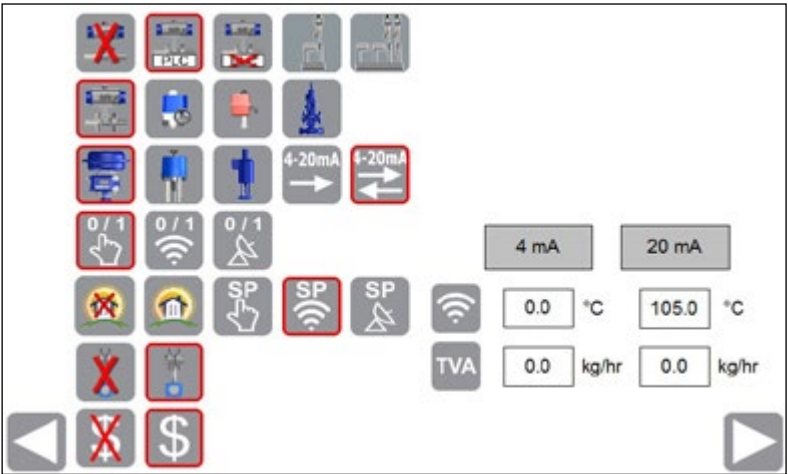

Fig. 31

A continue button will appear after system configuration which will navigate to the logged energy data for the Spirax EasiHeat™ system, press the continue button to navigate to the energy set-up page.

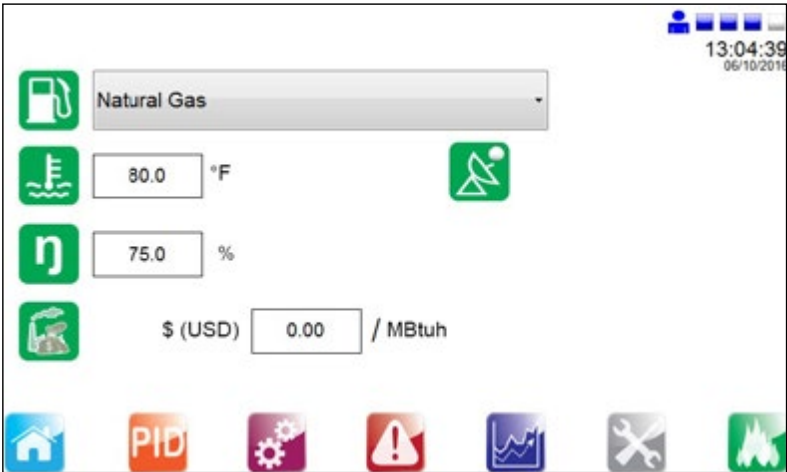

Fig. 32

Accurately enter specific energy data to ensure valid energy data can be calculated.

Boiler fuel properties - Selected via the drop down menu

Boiler feedwater temperature

Boiler efficiency

Cost per unit of fuel

Override energy set points with BACnet set points

In addition enter the custom fuel set points by selecting the custom fuel type.

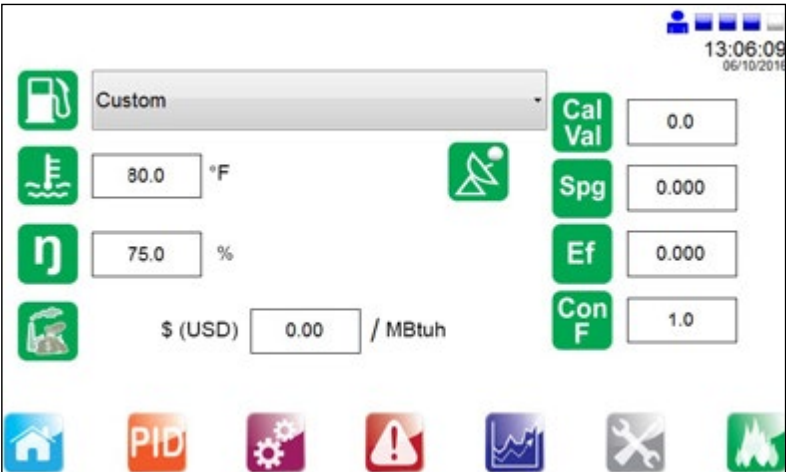

Fig. 33

Custom fuel parameters to be set:

Fuel calorific value

Fuel specific gravity

Fuel emission factor

Fuel conversion heat factor

Energy setting will not affect control process, to obtain correct values of the calculated energy, the accurate data settings are essential.

4.4 Global navigation buttons

4.4.1 Home mimic

This button will always navigate you back to the overview of the Spirax EasiHeat™ system that has been selected and configured.

From this home screen the overall status and control of the Spirax EasiHeat™ systems operation can be performed, depending on the security level access.

Fig. 34

Images shown below are dialogue pages that are only available for engineers access, which allow control over the valves, it is possible to enter those dialogs by pressing the screen surface at one of the unit devices (valves). This will allow the setting of the operation mode AUTO or MANUAL in which we are able to open /close the valves.

Fig. 35

V1 dialog page contains two value fields, the top one show the actual control valve position, and the lower one can be used to move the valve to requested position in manual mode.

Automatic Mode

Manual Mode

The light indicator shows what mode is selected.

PID set point

This pop-up menu allows the entry of the Spirax EasiHeat™ system target PID set point and the associated ramp-up and ramp-down time bases.

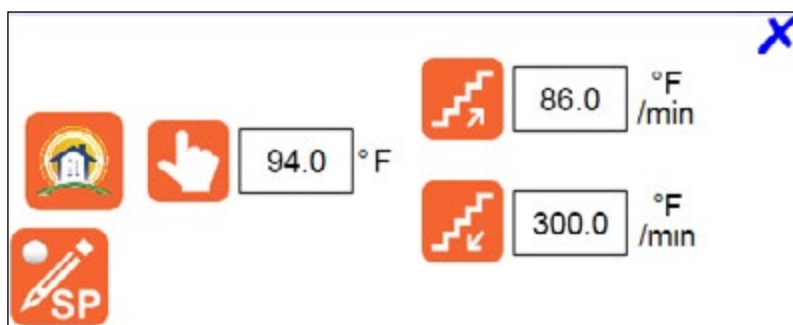

Fig. 36

Manual alarm indication icon

Caution - high-limit setting:

- If fitted, the high-limit controller should be set at a suitable level to protect plant, process and personnel.
- Care should be taken to ensure sufficient difference between the process set point and the high-limit set point, to avoid any unwanted high limit tripping.
- Check temperature rises to set value and controls satisfactorily.
- If necessary adjust PID settings. We would strongly recommend that only a suitably trained controls engineer adjust these parameters.
- Check operation of steam traps/condensate pump.

4.4.5 Trend menu

This menu provides historical trend monitoring of the process values, useful for analysing the historical reactions of the Spirax EasiHeat™ system to process conditions.

4.4.8 Energy logging

Energy monitoring pages provide the user access to view the total value of the power and carbon use, total of CO₂ emission and calculated total cost of energy that has been used. By pressing the green field underneath the 'Total Between Two Dates' allows two dates to be set for the total to be calculated between.

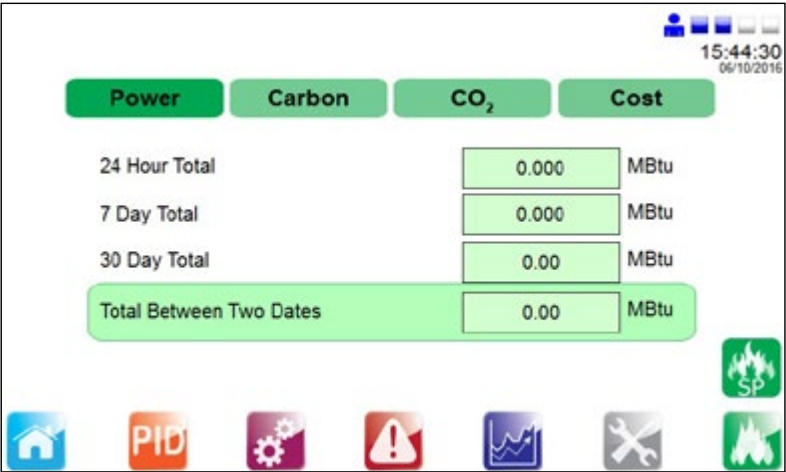

Fig. 55

Energy monitoring set points

At engineer level it is possible to access the energy page to make changes by pressing the energy monitoring set point. This will go to the energy page.

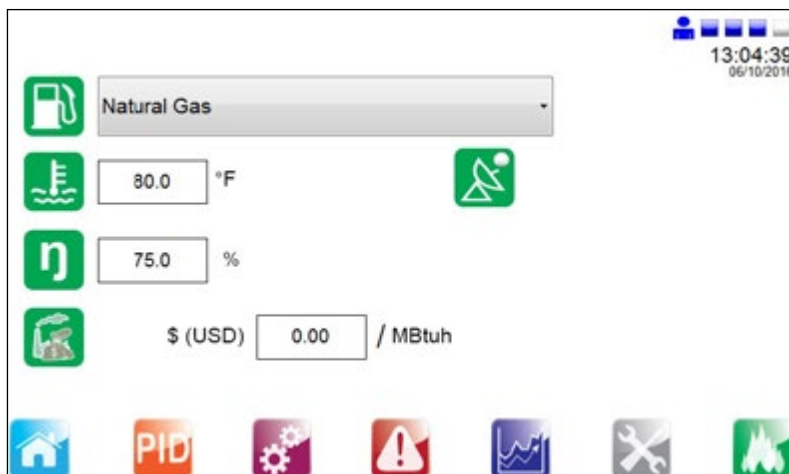

Fig. 56

To finalise the mechanical commissioning of the system:

- Open all condensate drain valves.
- Slowly open the steam inlet valve.
- Monitor the process temperature to ensure that it is within the acceptable limits.

The Spirax EasiHeat™ unit is now ready for service.

5. Fault finding

Fault	Possible cause	Remedial action
Unit does not power up	Loss of incoming supply	Check incoming supply
	Internal fuse blown	Check all mains fuses F1 - F4 and Control fuses AF1, CF1 - CF7
Loss of 24 Vdc supply	Internal fuse blown	Check all mains fuses F1 - F3 and Control fuses CF1 - CF7
	Field wiring fault	Sequentially disconnect the field wiring for all 24 Vdc supplies to see if supply is restored
Loss of 24 Vac supply	Internal fuse blown	Check all mains fuses F1 and F2 and Control fuses AF1
PT100 signal not reading correctly (T1 - T5)	Field wiring fault	Check termination of 3 wire PT100 terminats (X1 - X5) and PT100 head
	Faulty PT100	Check compensated resistance
Bypass pump does not operate	Field wiring fault	Check wiring of pump to terminals X11
	Internal fuse blown	Check mains fuse F4
Bypass valve does not operate	Field wiring fault	Check wiring of bypass valve to terminals X12
	Check setting of deviation alarm on HMI	Ensure not to set 0, the setting should be 2C
Remote set point is not showing correctly	Scaling value incorrect	Ensure that the minimum and maximum engineering units from the remote set point match those on the HMI (this data is found on the Spirax Sarco engineers 4-20 mA page)
	Polarity of 4-20 mA incorrect	Reverse polarity and wire as per electrical drawings
TVA flowmeter does not power up	Field wiring fault	Check wiring of TVA to terminal X8
	Loss of loop power	Check control fuse CF3
TVA input is not showing correctly	Scaling value incorrect	Ensure that the minimum and maximum engineering units from the TVA commissioning match those on the HMI (this data is found on the Spirax Sarco engineers 4-20 mA page)
	Polarity of 4-20 mA incorrect	Reverse polarity and wire as per electrical drawings

6. Maintenance

Note: Before actioning any maintenance observe the 'Safety information' in Section 1.

6.1 General

For maintenance of the individual components that make up the system, please see the relevant product specific IMI's for the components concerned.

6.2 High-limit device testing

The purpose of the test is to ensure that the system operates satisfactorily when required to do so.

Method:

1. High-limit set point test - The set point of the high-limit controller should be lowered, to simulate a high temperature situation. Test personnel should ensure the high-limit device operates in a satisfactory manner.

2. Electrical power failure test - The unit should be turned off at the PLC controller switch to simulate power failure. Examination should be made to ensure the high-limit system has switched to its fail-safe mode, isolating the primary steam supply.

Frequency

It is essential that a competent person tests the high-limit device on a frequent basis. Intervals between tests should not exceed a six month period.

We do not recommend the installation of a self-acting high-limit control to the Spirax Easiheat™ system.

6.3 Scale formulation

Within open systems, where there is continual make-up water, there is a risk of scale formation. The extent of the scale will depend largely upon the water quality, which varies greatly from area to area. A test, conducted by a water treatment specialist, is recommended to determine the local water quality and whether problems are foreseen.

After extended service, the plate heat exchanger can be easily dismantled for cleaning. If scale becomes a persistent problem, regular chemical cleaning should be considered. 3/4" ports are available on the secondary inlet and outlet piping to allow easy connection for CIP 'Clean in Place' apparatus. It should be noted that raising the steam pressure could result in an increase of scaling.
