Copyright © Spirax-Sarco Limited 2017

All rights reserved
Spirax-Sarco Limited grants the legal user of this product (or device) the right to use the Work(s) solely within the scope of the legitimate operation of the product (or device). No other right is granted under this licence. In particular and without prejudice to the generality of the foregoing, the Work(s) may not be used, sold, licensed, transferred, copied or reproduced in whole or in part or in any manner or form other than as expressly granted here without the prior written consent of Spirax-Sarco Limited.
1. Safety information

In addition to putting your personnel at risk of death or serious harm, failure to comply with the instructions, recommendations and guidance set out in this document may jeopardise your warranty rights. Further, use of the product(s) otherwise than in accordance with this document will be undertaken entirely at your own risk. To the fullest extent legally permitted, Spirax Sarco excludes all responsibility and liability for any and all loss or damage caused in the event that the practices and procedures detailed in this document have not been followed.

Safe operation of this product can only be guaranteed if it is properly installed, commissioned, used and maintained by qualified personnel (see Section 1.11) in compliance with the operating instructions. General installation and safety instructions for pipeline and plant construction, as well as the proper use of tools and safety equipment must also be complied with.

Note: This document refers only to the mechanical installation and commissioning of the Spirax EasiHeat™ packaged heat exchange system and should be used in conjunction with the relevant IMIs for the other system components and supplementary safety information for all the system components.

Warning - Lifting
The Spirax EasiHeat unit should be lifted by a suitable forklift truck, from the base, placed in position and securely bolted to the floor.

On no account is the Spirax EasiHeat™ unit to be lifted by any other part, other than the base.

Note: Sufficient space should be provided around the systems location to allow access for maintenance.

Warnings - General:
1. This product is designed and constructed to withstand the forces encountered during normal use.

2. Use of the product for any purpose other than its intended use could cause damage to the product and may cause injury or fatality to personnel.

3. Before any installation or maintenance procedure, always ensure that all primary steam and condensate return lines and secondary water lines are isolated.

4. Ensure any residual internal pressure in the system or connecting pipework is carefully relieved.

5. Allow hot parts to cool before commencing work, to avoid the risk of burns.

6. Always wear appropriate safety clothing before carrying out any installation or maintenance work.
Warning - Anti-legionella cycle:
The temperature set-point during the anti-legionella cycle will exceed normal operating temperatures and could cause scalding if water is used during the cycle.

The cycle should only be initiated when it is safe to do so.

There must also be water drained from the circuit at the end of the cycle to assist in reducing the water temperature.

1.1 Intended use
Referring to the Installation and Maintenance Instructions, name-plate and Technical Information Sheet, check that the product is suitable for the intended use/application.

i) The product has been specifically designed for use on steam or water/condensate. The products’ use on other fluids may be possible but, if this is contemplated, Spirax Sarco should be contacted to confirm the suitability of the product for the application being considered.

ii) Check material suitability, pressure and temperature and their maximum and minimum values. If the maximum operating limits of the product are lower than those of the system in which it is being fitted, or if malfunction of the product could result in a dangerous overpressure or overtemperature occurrence, ensure a safety device is included in the system to prevent such over-limit situations.

iii) Determine the correct installation situation and direction of fluid flow.

iv) Spirax Sarco products are not intended to withstand external stresses that may be induced by any system to which they are fitted. It is the responsibility of the installer to consider these stresses and take adequate precautions to minimise them.

v) Remove protection covers from all connections and protective film from all name-plates, where appropriate, before installation on steam or other high temperature applications.

1.2 Access
Ensure safe access and if necessary a safe working platform (suitably guarded) before attempting to work on the product. Arrange suitable lifting gear if required.

1.3 Lighting
Ensure adequate lighting, particularly where detailed or intricate work is required.
1.4 Hazardous liquids or gases in the pipeline
Consider what is in the pipeline or what may have been in the pipeline at some previous time. Consider: flammable materials, substances hazardous to health, extremes of temperature.

1.5 Hazardous environment around the product
Consider: explosion risk areas, lack of oxygen (e.g. tanks, pits), dangerous gases, extremes of temperature, hot surfaces, fire hazard (e.g. during welding), excessive noise, moving machinery.

1.6 The system
Consider the effect on the complete system of the work proposed. Will any proposed action (e.g. closing isolation valves, electrical isolation) put any other part of the system or any personnel at risk? Dangers might include isolation of vents or protective devices or the rendering ineffective of controls or alarms. Ensure isolation valves are turned on and off in a gradual way to avoid system shocks.

1.7 Pressure systems
Ensure that any pressure is isolated and safely vented to atmospheric pressure. Consider double isolation (double block and bleed) and the locking or labelling of closed valves. Do not assume that the system has depressurised even when the pressure gauge indicates zero.

1.8 Temperature
Allow time for temperature to normalise after isolation to avoid the danger of burns. Warning: The temperature set-point during the anti-legionella cycle will exceed normal operating temperatures and could cause scalding if water is used during the cycle. The cycle should only be initiated when it is safe to do so. The water must also be drawn from the system at the end of the cycle to assist in reducing the water temperature trapped within the system.

1.9 Tools and consumables
Before starting work ensure that you have suitable tools and/or consumables available. Use only genuine Spirax Sarco replacement parts.

1.10 Protective clothing
Consider whether you and/or others in the vicinity require any protective clothing to protect against the hazards of, for example, chemicals, high/low temperature, radiation, noise, falling objects, and dangers to eyes and face.
1.11 Permits to work
All work must be carried out or be supervised by a suitably competent person. Installation and operating personnel should be trained in the correct use of the product according to the Installation and Maintenance Instructions. Where a formal 'permit to work' system is in force it must be complied with. Where there is no such system, it is recommended that a responsible person should know what work is going on and, where necessary, arrange to have an assistant whose primary responsibility is safety. Post 'warning notices' if necessary.

1.12 Handling
Manual handling of large and / or heavy products may present a risk of injury. Lifting, pushing, pulling, carrying or supporting a load by bodily force can cause injury particularly to the back. You are advised to assess the risks taking into account the task, the individual, the load and the working environment and use the appropriate handling method depending on the circumstances of the work being done. Please note that if lifting straps are required we would recommend that they be fitted around the baffle plate legs to prevent damage to the unit.
2. General product information

2.1 General information
The Spirax EasiHeat HTG system uses steam to provide accurate heating of potable hot water or hot water for processes. Systems are supplied fully assembled and pressure tested ready for installation.

The Spirax EasiHeat HTG unit consists of the following core items (refer to Figure 1):

A  Plate heat exchanger.
B  Pneumatic or electrically actuated control valve and positioner.
C  PLC controller.
D  High limit isolation valve.
E  Condensate removal.

Notes:
1. For additional information about any particular product used in the construction of this unit see the relevant product specific Technical Information (TI) sheet.
2. For further technical information regarding the Spirax EasiHeat HTG see the Technical Information sheet TI-P481-11.

3. Installation

3.1 Steam and condensate connections
It is important that the steam supply (and compressed air if pneumatic actuation is selected) to the Spirax EasiHeat™ unit is supplied as dry and as clean as possible, in accordance with good steam engineering practice.
It should also be ensured that all connecting pipework is stress free and adequately supported.
The steam supply should always be maintained at the specified design pressure and temperature for the unit. The Spirax EasiHeat™ must not operate above the maximum steam pressure and temperature indicated on the name-plate attached to the plate heat exchanger.
The installation of an appropriately sized safety valve, to protect any lower pressured equipment on either the hot or cold side of the plate heat exchanger, is strongly recommended.
Spirax Sarco supplies a range of traps, strainers, separators, safety valves and pressure reducing equipment.

3.2 Air supply
If a pneumatic control system is installed, connect a compressed air supply (65 to 116 psi g) to the pressure regulator mounted on the control valve.

3.3 Electrical supply
All electrical wiring and connections should be carried out in accordance with National Regulations.
A lockable isolator / switch disconnect should be fitted adjacent to the unit.
Mains supply is directly connected to the primary side of the incoming control panel isolator (shown with the IP2X cover removed) and main ground terminal as shown in Figure 2.

1. Basic
2. Independent high limit
3. Independent high limit with safety
4. American standard

- X1 - Water temperature IN
- X2 - Water temperature OUT
- X3 - Make up water
- X4 - Return water
- X5 - High limit temperature

Group X6 to X10A

- X6 - Linear actuator feedback
- X7 - Remote PID loop set point
- X8 - Steam meter
- X9 - Retransmission value
- X10A - Linear actuator control position

Group X10B to X13C

- X10B - Linear actuator closed signal
- X10C - Linear actuator supply voltage (Linear actuator A - Electric actuator only)
- X10D - Linear actuator B supply
- X10F - Positioner A DC supply
- X10G - Positioner B DC supply
- X11 - Bypass pump
- X12 - Bypass valve
- X13 - High limit valve
- X13A - High limit valve control output signal
- X13B - High limit valve supply voltage (electric actuator only)
- X13C - High limit valve battery signal

Group X14 to X17

- X14 - Volt free signal for enabled
- X15 - Volt free high limit
- X16 - Volt free band alarm
- X17 - Remote enable signal
4. Commissioning

We strongly recommend that you use the service and support of a Spirax Sarco commissioning engineer. Details of this service can be found by contacting Spirax Sarco.

**Note:** Pre commissioning requirements:

- In most new installations, dirt collects in the steam pipeline during construction of the system. It is essential to flush this out prior to commissioning.

- Ensure the secondary (cold side) of the system is charged and all air is bled from the system.

- Ensure that all main isolation valves for both steam and water are isolated.

- Ensure that the electrical supply to the Spirax EasiHeat is isolated.

- Double check that all steam, condensate and water connections are correctly connected to the Spirax EasiHeat.

- Check all flange bolts are tight.

**4.1 Mechanical commissioning procedure:**

- Check that all of the electrical connections are secure and as per the wiring diagram (Section 3.3, Figure 2).

- Dry commissioning valve stroke check - An initial valve stroke check should be carried out to ensure free movement of the valve stem.

1. For the electric actuated control valve, use the manual override on top of the actuator to raise and lower the actuator spindle between the two travel indicators located on the side of the pillar (Figure 6).

2. For the pneumatic actuated control valve, remove the existing air supply and connect an independent air supply to the actuator (pressure not to exceed 87 psi g), allow the valve to fully open, remove the air supply from the actuator allowing the valve to close. Reconnect the original pipework (Figure 7).
- Open the secondary (cold side) isolating valves downstream of the Spirax EasiHeat.
- Start the main secondary water circulating pump(s) if fitted.
- Check and confirm there is secondary water circulation through the Spirax EasiHeat.
- If the circulation is okay, switch on the main power to the control panel (local isolator).
- Turn the control panel isolation switch to ‘ON’.
- Follow the quick start-up guide (Section 4.2) before opening the steam isolations valves.

4.2 TVA quick commissioning:
The TVA flowmeter is factory set to display data in metric units (changeable to imperial if required by following the flow chart, Figure 10, or the individual product Installation and Maintenance Instructions (IMI)).

All commissioning of the TVA is through the arrow buttons located on the front display see Figure 8.

![Image of TVA control panel]

**Fig. 8**

Press and hold down the 'OK' button and hold for 3 seconds, then enter the default pass code.

Use the up and down arrows to set the number then press OK to confirm your selection, repeat until all numbers are entered.
TVA flowmeter commissioning chart

To navigate around the first level menu use the up and down arrows, to enter any sub menu use the right arrow.

Fig. 10 TVA configuration displays

Error Messages
These alternate with the normal run mode display. They will be prioritised and will be latched when they occur. Pressing the ‘OK’ button will cancel the displayed alarm and allow the next one to be viewed. A continuous alarm will re-occur on the display 2 seconds after it has been cancelled.

Power interrupted
NO SIGNAL
Signal from sensor constant
SENSR CONST
Flow above maximum
HIGH FLOW
The 4-20 mA alarm can also be activated

Power
OUT

The 4-20 mA alarm can also be activated

Connect a DVM and use the up and down keys to set 4 or 20 mA
From the Basic dAtA menu navigate to OUtPUts and press the right arrow to enter the sub menu of 4 - 20 mA.

The next menu Source will need FLOW to be selected.

Obtain the correct flow data from the Spirax EasiHeat™ specification sheet supplied for accuracy, thereafter navigate down the menu and input:

Minimum flow = 4 mA
Maximum flow = 20 mA

After this data has been input, continually press the left arrow button to take you back to the run mode.

This completes the basic requirement for scaling of the TVA flowmeter suitable for integration with the HMI.
4.3 HMI quick start commissioning procedure:
The HMI display is a 7” touch screen, and the following procedures detail a basic set-up of the control system from initial power up. A more detailed description of each individual feature can be found in the full operation and maintenance manual.

Fig. 13

When ready the above screen will appear, touch the screen. If the unit has not been configured for previous use following page will appear.

Fig. 14

To be able to move to next page the unlock code is essential, which can be found on the authentication certificate supplied with the panel. After entering the proper code, the lock and the continue button will appear when pressed and transfer you to the time/date setting page.
After and setting the time and date or if the unit has been returned to factory default the following four pages will appear (pre-configured for designated region):

By choosing the relevant flag for your Country the common default engineering units and language will automatically be selected for that region. These values can be changed after the initial commissioning set-up procedure has been completed (see Section 4.3.3).

The system will advance automatically to allow the selection of the relevant Spirax EasiHeat unit - The type of Spirax EasiHeat unit that is available is dependent on the flag selection.
The next screen (Figure 17) requires confirmation of the system to be configured.

Fig. 17

Select the EHHSC option, the selection shall be confirmed by the icon becoming highlighted with a blue surround and a continue button shall be revealed.

Press the continue button to advance to the system configuration menu.

Fig. 18

The system configuration is now required to be entered on this page; again a selection is highlighted by a blue surround around the icon.

Note: dependant on selected configurable requirements some of the icons shown above will not be available.
System configuration should match the mechanical configuration of the EasiHeat Steam side control and control system of the plant, proper configuration will show or hide options available after configuration. Some of the screens may contain additional options which with specified configuration may be hidden; all the options are described in this document.
Spirax EasiHeat mechanical and control system configuration options are detailed as follows:

**Fig. 20 High-limit selection**

- Not installed
- PLC controlled (default)
- Independently controlled

**Fig. 21 ¼ turn actuator selection**

- Pneumatic
- PSA
- Valpes
- DP27E

Fig. 25 PID set point selection

Local
OWC

Local set point
Remote set point

EasiHeat selected

The system configuration is now complete and the continue navigation button at the right-base of the screen can be used to navigate to the next page which is the Start Page (Figure 8 - Blue hand).
TVA not installed and local set point selected

If the Spirax EasiHeat™ unit is not fitted with a TVA flowmeter then the system configuration is now complete and the continue navigation button at the right-base of the screen can be used to navigate to next page which is the Start Page (Figure ?? - Blue hand).

![Fig. 27](image)

TVA installed and remote set point selected

On TVA flowmeter selection a data entry point shall be displayed in order for effective scaling of the flowmeter (full engineering range for the 4-20 mA signal input to the Spirax EasiHeat™ system). The full range values entered at this point should match exactly those that are programmed in the TVA flowmeter parameters (Refer to Sections 4.2 and 4.2.1 for TVA commissioning data) as well as remote set point.

![Fig. 28](image)
A continue button will appear after system configuration which will navigate to the logged energy data for the Spirax EasiHeat™ system.

Press the continue button to navigate to the energy set up page.

![Fig. 29](image)

Accurately enter specific energy data to ensure valid energy data can be calculated.

- Boiler fuel properties - Selected via the drop down menu
- Boiler feedwater temperature
- Boiler efficiency
- Cost per unit of fuel
- Override energy set points with BACnet set points
In addition enter the custom fuel set points by selecting the custom fuel type.

Custom fuel parameters to be set:

- Fuel calorific value
- Fuel specific gravity
- Fuel emission factor
- Fuel conversion heat factor

Energy setting will not affect control process, to obtain correct values of the calculated energy, the accurate data settings are essential.
In addition enter the custom fuel set points by selecting the custom fuel type.

### 4.5.1 Home mimic

This button will always navigate you back to the overview of the Spirax EasiHeat system that has been selected and configured.

From this home screen the overall status and control of the Spirax EasiHeat systems operation can be performed, depending on the security level access.

**Note:** access level 1 has view access to screens and limited change permissions. Level 2 (engineers) access provides a greater accessibility to make adjustments to the system settings. The screen shots from this point onwards refer to level 2 access.

![Fig. 32](image)
In case of configuring unit as a SRDHW the following mimic will be used, which contains two linear actuator valves.

Images shown below are dialogue pages that are only available for engineers access, which allow control over the valves and pumps, it is possible to enter those dialogs by pressing the screen surface at one of the unit devices (valves or pump). We are able to set the operation mode AUTO or MANUAL in which we are able to start/stop the pump or open/close the valves.

**Fig. 33**

V1 dialog page contains two value fields, the top one shows the actual valve position, and the bottom one can be used to move the valve to requested position in manual mode.

The light indicator shows which mode is selected.
This pop-up menu, depending on the configuration, allows users to either set the local temperature set point or view the remote or BACnet temperature set point and enter the Spirax EasiHeat system PID associated ramp up and ramp down time bases. If the configuration were set to BACnet, it is possible to override the configuration and change it to local enable.

![Fig. 34](image)

- Local temperature set point
- Remote temperature set point (DHW and SRDHW only)
- BACnet temperature set point (DHW or SRDHW only) remote
- Ramp-up temperature set point
- Ramp-down temperature set point
- BACnet temperature set point override with local temperature set point (DHW or SRDHW and BACnet selection only)
Enable control

This pop-up menu depending on the configuration, allows the user to select one of three control modes for the Spirax EasiHeat or view the remote or BACnet enable status. If the configuration were set to BACnet, it is possible to override the configuration and change it to local enable configuration.

Fig. 35

- Spirax EasiHeat OFF mode
- Spirax EasiHeat ON mode
- Remote or Communications EasiHeat enable
- Communications EasiHeat™ enable override with local Spirax EasiHeat™ enable (Communications selection only)
The zoom pop-up provides a more detailed view of the key process parameters.

4.3.2 PID set points

This page allows setting of the PID control factors (entries available only for engineers). Press on the white data box to make changes.
The following screen is accessible from above PID Loop Set Points page (available only for engineers). We are able to switch between proportional band and proportional gain. Trend shows us PID loop real time responses. The SV, PV and CV values at PID Real Time Trend are scaled to percent.

**Fig. 38**

![PID Real Time Trend](image)
4.3.3 Settings menu

The settings displayed (with blue surround) are default settings after the country flag has been selected, changes can be made if required.

Fig. 39

Time/date configuration page
Language selection page
Temperature units selection
There is also the possibility of changing the language (from the pre-configured options) by using the following selection menu without affecting the engineering units:

![Selection Menu](image)

**Fig. 40**

In addition, engineers are able to set or change the actual time and date for PLC and HMI.

![Time and Date Setting](image)

**Fig. 41**
4.3.4 Alarms menu

The following page shows all active alarms, an active alarm is indicated on all the mimic screens via the alarm bell in the top left hand corner of the screen.

There are also navigations to further alarm set point pages as well as the historical alarm list, located on the right of the display. Press each of them to view or alter.

**High-limit alarm set point**
(PLC controlled only)

**High-limit temperature set point**

**High-limit temperature mask time**
Band alarm

Band alarm temperature set point

Band alarm delay time set point

Band alarm reset time set point
Reset high-limit alarm latch
(PLC controlled high-limit only)

Historical alarm page

Fig. 43

Alarms indication icon

Manual alarm indication icon

Caution - high-limit setting:

- Care should be taken to ensure sufficient difference between the process set point and the high-limit set point, to avoid any unwanted high limit tripping.
- Check temperature rises to set value and controls satisfactorily.
- If necessary adjust PID settings. We would strongly recommend that only a suitably trained controls engineer adjust these parameters.
- Check operation of condensate removal system.
4.3.5 Trend menu

This menu provides historical trend monitoring of the process values, useful for analysing the historical reactions of the Spirax EasiHeat system to process conditions.

Temperature trend page button

PID process trend page button
4.3.6 Service menu

The following page provides service information and allows engineering level users to navigate to pages containing process information.

![Service menu screenshot](image)

**Save trends to USB memory stick.**

This LED if green confirms that the memory stick is connected and the data format is correct (FAT32 only allowed).

This LED is switched on only during the trend dump, do not remove the memory stick before it is switched off or data may be lost.

**Note:** Depending on the amount of data to be dumped can take several minutes).

- **Total unit runtime**
- **Time lapsed since last service**
Next service due at number of hours

4.5.8 Energy pages

Energy monitoring pages provide the user access to view the total value of the power and carbon use, total of CO$_2$ emission and calculated total cost of energy that has been used. By pressing the green field underneath the 'Total Between Two Dates' allows two dates to be set for the total to be calculated between.

Fig. 52
At engineer level it is possible to access the energy page to make changes by pressing the energy monitoring set point. This will go to the energy page.

![Energy monitoring set points page](image)

To finalise the mechanical commissioning of the system:
- Open all condensate drain valves.
- Slowly open the steam inlet valve.
- Monitor the process temperature to ensure that it is within the acceptable limits.

**The Spirax EasiHeat™ unit is now ready for service.**
## 5. Fault finding

6. Maintenance

Note: Before actioning any maintenance observe the 'Safety information' in Section 1.

6.1 General
For maintenance of the individual components that make up the system, please see the relevant product specific IMI's for the components concerned.

6.2 High limit device testing
The purpose of the test is to ensure that the system operates satisfactorily when required to do so.

Method:
1. High limit set point test - The set point of the high limit controller should be lowered, to simulate a high temperature situation. Test personnel should ensure the high limit device operates in a satisfactory manner.

2. Electrical power failure test - The unit should be turned off at the PLC controller switch to simulate power failure. Examination should be made to ensure the high limit system has switched to its fail-safe mode, isolating the primary steam supply.

Frequency
It is essential that a competent person tests the high limit device on a frequent basis. Intervals between tests should not exceed a six month period.
We do not recommend the installation of a self-acting high limit control to the Spirax EasiHeat system.

6.3 Scale formulation
Within open systems, where there is continual make-up water, there is a risk of scale formation. The extent of the scale will depend largely upon the water quality, which varies greatly from area to area. A test, conducted by a water treatment specialist, is recommended to determine the local water quality and whether problems are foreseen.

After extended service, the plate heat exchanger can be easily dismantled for cleaning. If scale becomes a persistent problem, regular chemical cleaning should be considered. ¾" ports are available on the secondary inlet and outlet piping to allow easy connection for CIP 'Clean in Place' apparatus. It should be noted that raising the steam pressure could result in an increase of scaling.
